

Preface

Here are a set of practice problems for my Calculus I notes. If you are viewing the pdf version of this document (as opposed to viewing it on the web) this document contains only the problems themselves and no solutions are included in this document. Solutions can be found in a number of places on the site.

1. If you'd like a pdf document containing the solutions go to the note page for the section you'd like solutions for and select the download solutions link from there. Or,
2. Go to the download page for the site <http://tutorial.math.lamar.edu/download.aspx> and select the section you'd like solutions for and a link will be provided there.
3. If you'd like to view the solutions on the web or solutions to an individual problem you can go to the problem set web page, select the problem you want the solution for. At this point I do not provide pdf versions of individual solutions, but for a particular problem you can select "Printable View" from the "Solution Pane Options" to get a printable version.

Note that some sections will have more problems than others and some will have more or less of a variety of problems. Most sections should have a range of difficulty levels in the problems although this will vary from section to section.

I add problems to this document as I get a chance and so that means that sometimes some sections are apparently given more attention than others. Eventually I'll have a full complement of problems for all the sections, however it takes time to write the problems, write the solutions for each problem and format them for presentation on the web. If there aren't practice problems for a given section (or there aren't that many problems in a section) then know that I will eventually get around to writing problems for the section (or more problems for the section as the case may be).

Please do not email me asking when I'm going to get problems for a particular section written. As I've already said, I write problems as I have time to do so. Please understand that I have my own classes to teach and other responsibilities to my department that I have to also take care of. This web site and all of its information has been written and maintained in my spare time and that often means that I don't have as much time to work on it as I'd like to.

The Mean Value Theorem

For problems 1 & 2 determine all the number(s) c which satisfy the conclusion of Rolle's Theorem for the given function and interval.

1. $f(x) = x^2 - 2x - 8$ on $[-1, 3]$

2. $g(t) = 2t - t^2 - t^3$ on $[-2, 1]$

For problems 3 & 4 determine all the number(s) c which satisfy the conclusion of the Mean Value Theorem for the given function and interval.

3. $h(z) = 4z^3 - 8z^2 + 7z - 2$ on $[2, 5]$

4. $A(t) = 8t + e^{-3t}$ on $[-2, 3]$

5. Suppose we know that $f(x)$ is continuous and differentiable on the interval $[-7, 0]$, that $f(-7) = -3$ and that $f'(x) \leq 2$. What is the largest possible value for $f(0)$?

6. Show that $f(x) = x^3 - 7x^2 + 25x + 8$ has exactly one real root.
